

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. – 4. (Cancelled).

5. (Currently Amended) An adaptor according to claim [[4]] 6, wherein the one or more features comprise a first third set located adjacent to the predetermined position of the reservoir interface relative to the adaptor, the first third set of features being arranged to locate a plurality of reservoir types.

6. (Currently Amended) An adaptor according to claim 5, for use in a hardcopy device, comprising a reservoir supporting element movable relative to the adaptor between first and second positions, the supporting element being arranged to receive a reservoir when in the first position, and being further arranged, when moved to the second position, to bring an interface associated with the reservoir into a predetermined position relative to the adaptor,
wherein the supporting element is arranged to receive a reservoir such that an interface associated with the reservoir is located in a predetermined position relative to the supporting element,

wherein the supporting element is arranged to support any type of a set of reservoir types, each reservoir type having a different volume,

wherein the supporting element comprises one or more features, arranged in use to interact with one or more corresponding features of a reservoir, to maintain the reservoir substantially stationary relative to the supporting element, and

wherein the one or more features comprise at least second first and third second sets located distant to the predetermined position of the reservoir interface relative to the adaptor, the second first and third second sets of features each being arranged to locate a different reservoir type.

7. (Currently Amended) An adaptor according to claim [[4]] 6, wherein the one or more features comprise at least one of bosses and/or and recesses.

8. (Currently Amended) An adaptor according to claim [[1]] 6, further comprising at least one restraint adapted in use to oppose the expansion of the reservoir.

9. (Original) An adaptor according to claim 8, wherein the at least one restraint is located such that it is adjacent a reservoir when the support element is located in the second position but not the first position.

10. (Original) An adaptor according to claim 9, wherein the at least one restraint comprises first and second surfaces arranged to be located on opposing sides of the reservoir.

11. (Currently Amended) An adaptor according to claim [[1]] 6, wherein the support element is arranged to move substantially linearly between the first and second positions.

12. (Original) An adaptor according to claim 11, wherein the support element is arranged to slide between the first and second positions on a support surface associated with the adaptor.

13. (Original) An adaptor according to claim 12, wherein the support element is arranged to be moved manually between the first and second positions.

14. (Canceled).

15. (Currently Amended) A hardcopy device comprising an ink reservoir adaptor, the adaptor comprising a reservoir supporting element movable relative to the adaptor between first and second positions, the supporting element being arranged in the first position to receive a reservoir such that an interface associated with the reservoir is located in a predetermined position relative to the supporting element, the supporting element being further arranged, when moved to the second position, to connect the interface with a corresponding interface associated with the device.

wherein the supporting element is arranged to receive a reservoir such that an interface associated with the reservoir is located in a predetermined position relative to the supporting element,

wherein the supporting element is arranged to support any type of a set of reservoir types, each reservoir type having a different volume,

wherein the supporting element comprises one or more features, arranged in use to interact with one or more corresponding feature of a reservoir, to maintain the reservoir substantially stationary relative to the supporting element, and

wherein the one or more features comprise at least first and second sets located distant to the predetermined position of the reservoir interface relative to the adaptor, the first and second sets of features each being arranged to locate a different reservoir type.

16. (Currently Amended) A device according to claim 15, wherein the interface associated with the device is resiliently mounted relative to the interface associated with the reservoir, so as to regulate ~~the a~~ force between the two interfaces when the supporting element is located in the second position.

17. (Original) An inkjet device according to claim 15.

18. (New) An inkjet device according to claim 15, wherein the one or more features comprise a third set located adjacent to the predetermined position of the reservoir interface relative to the adaptor, the third set of features being arranged to locate a plurality of reservoir types.
